MTR/RCF Cement Free Rope Rubber

Another addition to the RCF (REMA TIP TOP Cement Free) product series, is a solvent free extruder rope rubber, **MTR/RCF Rope Rubber** (Item # 5160970).

MTR/RCF Rope Rubber is designed to extrude into the skive area without any application of Cement/Solution and provides an immediate optimum bond to the rubber of the tire.

The **MTR/RCF Rope Rubber** can be used to fill the entire skive in most applications. If irregular wear patterns develop in large injuries, it is suggested to line the skive area with the **MTR/RCF Rope Rubber** and then extrude the standard MTR Rope Rubber, MTR-CR (cut resistant) or other REMA TIP TOP brand extruder rope rubber to complete the filling process with rubber suitable for severe tread wear issues.

If the skive area has been sitting for a while or the rubber has a blue tint look to it, re-texture the skive area with the correct buffing rasp or a soft wire brush on a slow speed air tool.

In a retreading process, **MTR/RCF Rope Rubber** can be used directly for all buzz-outs and damages in the casing before being covered by the new tread rubber... without any cement application.

NOTE:

Do not mix REMA TIP TOP MTR/RCF Rope Rubber with other brands of rope rubber.
