There are many variables that contribute to vibration in “mudder” tires. Before installing Counteract, please consider the following sources of vibration, including but not limited to: Proper drive line angle, tire pressure, presence of a lift kit, tire run-out, wheel run-out, extreme side wall flex, tread ripple, and/or a lug pattern that may cause acoustical vibration. These factors, and others, will play a role in the vibration of the vehicle and Counteract will not correct these conditions. We cannot guarantee the elimination of all vibration sources.
